AB The fatty acid contents of 13 commercial preparations of human albumin
were in the range 0.03-9 mol of fatty acid/mol albumin. Marked
differences
were found between the preparations in the binding of the fluorescent
probes, 5-dimethylamino-naphthalene-1-sulfonamide (DNSA) and
dansylsarcosine. The displacement of these probes by ibuprofen and
phenylbutazone also showed marked differences between preparations. The
differences between the commercial albumin samples correlated well with
their fatty acid contents and were abolished by treatment with charcoal.
They were similar to the changes observed when oleic acid was added to
fatty acid free albumin. The source and fatty acid content of commercial
albumin preparations should be considered when comparing studies of the
binding of drugs to human albumin.

AB In early atherogenesis, excess plasma lipoproteins accumulate into the
arterial lesion-prone areas as modified and reassembled lipoproteins
(MRLp) appearing mostly as lipid droplets and vesicles. In the present
study we produced such MRLp, in a cell-free system, devoid of any
component of extracellular matrix, by subjecting in vitro human
low-density lipoproteins (LDL) to autoxidation or copper-induced
oxidation, for up to 96 h. As visualized by negative staining electron
microscopy, a large number of lipoprotein particles (Lp) were
progressively transformed into aggregates (ALp), fused particles (FLp)

and
the
by
vesicles (VLp). These modifications were paralleled by peroxidation of
samples as revealed by chemical analysis of each MRLp fraction isolated

a three-step purification procedure. LDL peroxidation in the above
conditions was inhibited by the presence of albumin as assessed by TBARS
and lipid analysis, and by the lack of MRLp formation. This protective
effect was independent of albumin source (bovine, human, rabbit) and
occurs at an albumin/LDL ratio of 1 when Cu-2+ was present, and at a
ratio

of 0.25 in autoxidative conditions. The results show that: (i) in vitro
LDL autoxidation or copper-induced peroxidation in a cell-free system can
generate modified and reassembled lipoproteins similar to those detected
in vivo in the arterial intima at the inception of atherogenesis; (ii) Lp
particles appear to be sequentially transformed in self-aggregates,
droplets and vesicles; (iii) serum albumin can completely prevent these
LDL alterations.
